

ELISA
Enabling **Linux** in
Safety Applications

WORKSHOP

ELISA Workshop Munich, Germany

November 18-20, 2025
Co-hosted with Red Hat

Beyond the OS: What else is required for safe automotive applications?

Agenda

- About Elektrobit
- The Safe OS
- The Safe Application
- Automotive Use-Cases

“

Our software moves the world

More than **600 million vehicles** with over **5 billion embedded** devices

The safe OS

Recap: making the OS „safe“

- There are different approaches.
- Argue that the OS kernel (trapeze artist) is safe.
- Prevent the OS kernel from causing harm by using a “safety net.” (ASIL Decomposition)

Achieved guarantees

Spatial freedom from interference

The Linux kernel and other applications cannot corrupt the memory of a safety-related application

Temporal freedom from interference

The kernel cannot block applications indefinitely

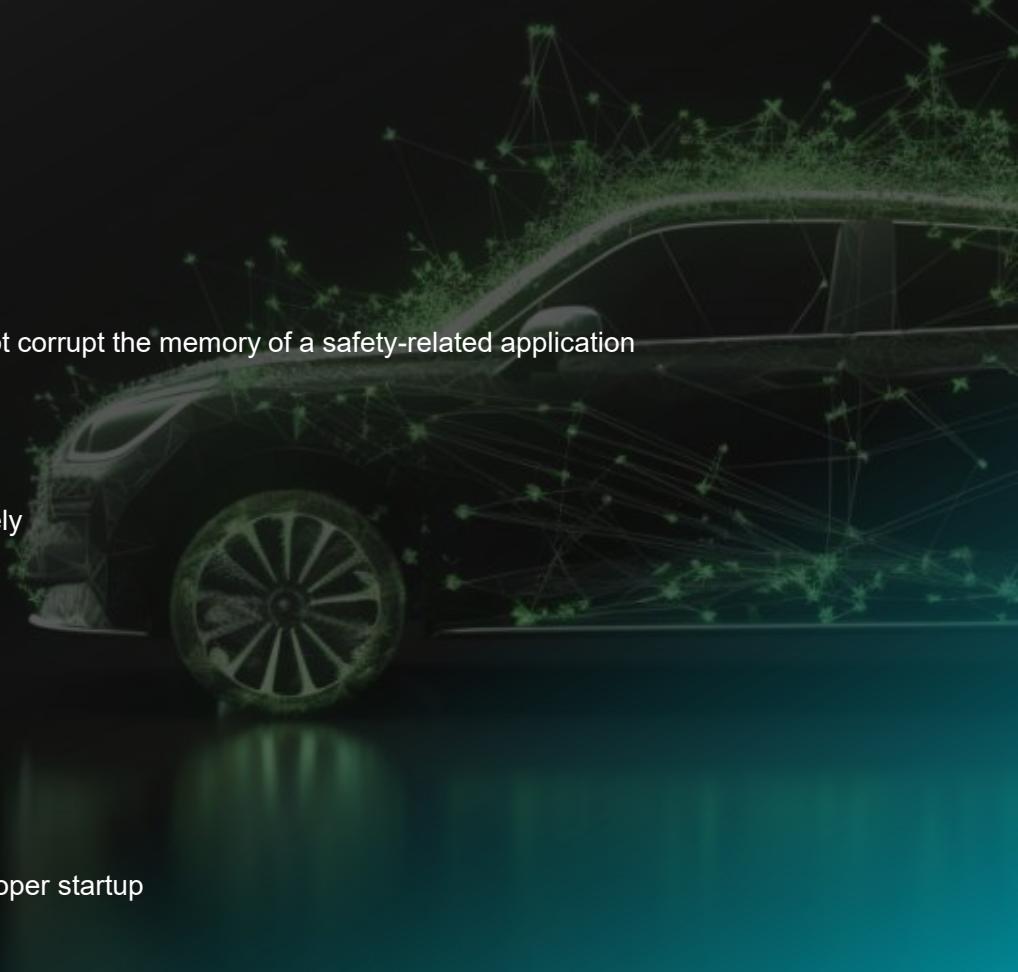

Communication integrity

Shared memory communication is protected

Startup integrity

Safety-related applications are checked for proper startup

The Open Source Advantage (1/2)

Start now in the cloud

- ✓ *Shift left:* Begin software development **6–12 months earlier**, even before hardware arrives
- ✓ *Scale globally:* Enable teams to work in parallel, **independent of hardware constraints**

Launch new projects faster

- ✓ *Accelerate onboarding:* Get developers, integrators, and testers **productive from day one**
- ✓ *Skip long ramp-ups:* Avoid the **6+ month learning curve** of proprietary systems

If you need it – build it

- ✓ Stay in control: Don't depend on someone else's roadmap or business case
- ✓ Leverage the community: Share development and maintenance effort
- ✓ Cut costs: Pay only a fraction for new features or components

The Open Source Advantage (2/2)

Innovate faster

- ✓ Deliver continuously: Ship new features and improvements at the pace your customers expect
- ✓ Build on shared progress: Leverage enhancements from a global open-source community

Use what works best

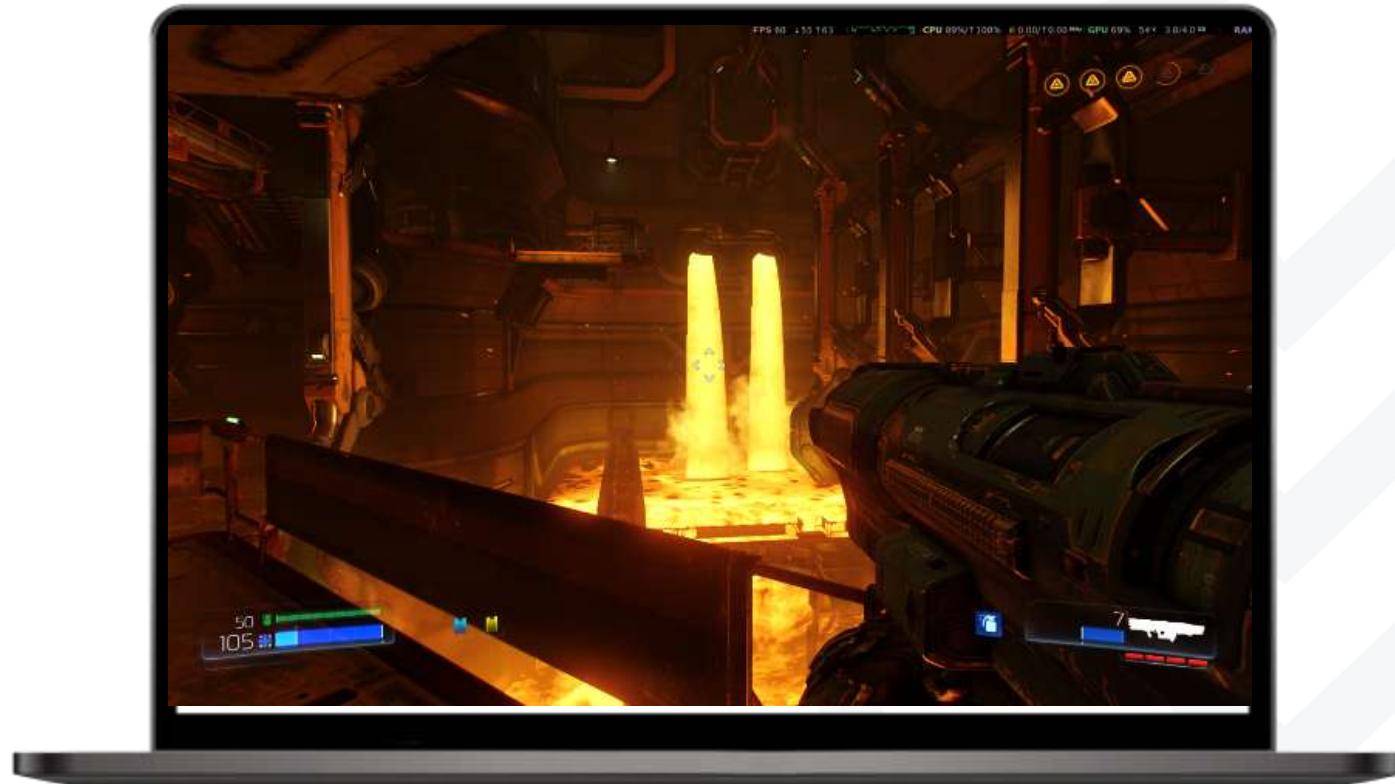

- ✓ Choose freely: Run the most performant, stable, and secure software for your needs
- ✓ Tailor with precision: Include only what you need — avoid bloat and maximize hardware efficiency

Deploy on the hardware you want

- ✓ Stay flexible: Don't let software vendors dictate your hardware options
- ✓ Use open standards: Leverage Linux VIRTIO support to stay independent of vendor lifecycles

And It Can Run Doom!

With the Help of the Community

The screenshot shows the protondb.com website for the game DOOM. The page displays a "PLATINUM" rating, a "Deck Verified Status" as "Verified", and a "Chromebook Ready Status" as "Unknown". Navigation links include Steam, SteamDB, Steamcharts, Steambase, PCGamingWiki, Github, Issue, and Search. A "Native Supports" section shows compatibility for ALL, PC, STEAM DECK, and CHROME OS, with a "Show Minimum Requirements" link. Below this, a "PC" tab is selected, showing "Reports 1 - 40 of 1097 Next". A "Filter" button is available. The main content area lists two reports:

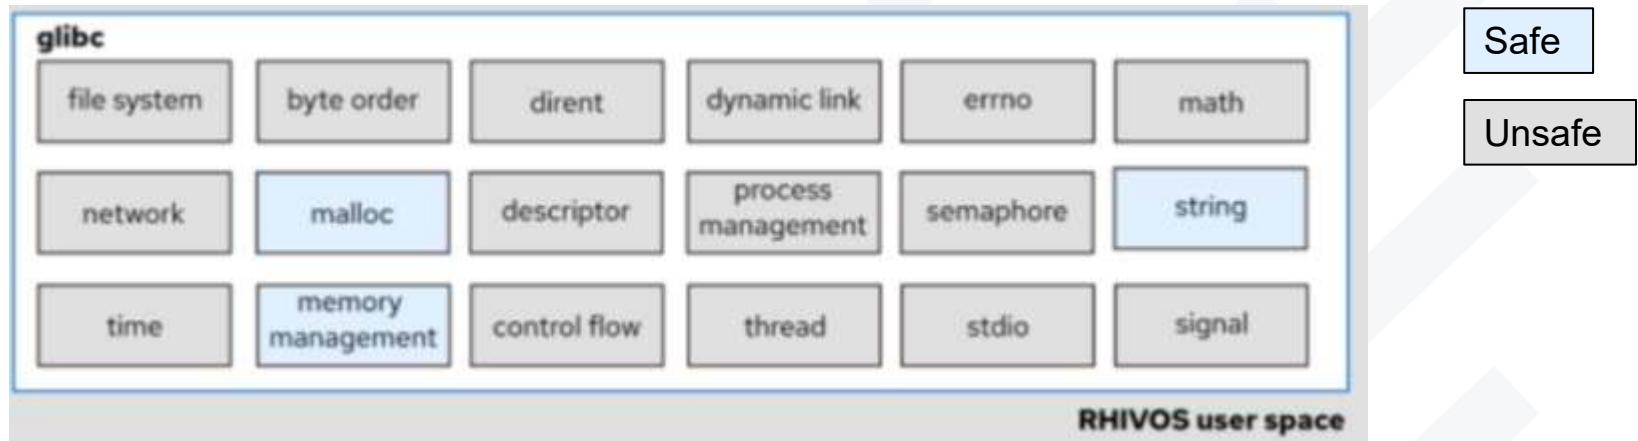

- aytyn (3 reports)**: A report from a user named "aytyn" with 3 reports. It includes a green thumbs-up icon and the text "No issues reported. Works out-of-the-box on CachyOS". The report was posted 1 week ago and includes a link to "Custom Proton: proton-cachyos-10.0-29251023".
 - Tinker Steps: Custom Proton: proton-cachyos-10.0-29251023**
 - Multiplayer**
 - Overall (online): Excellent**
 - Overall (local): Excellent**
- Catlyn (13 reports)**: A report from a user named "Catlyn" with 13 reports. It includes a yellow thumbs-up icon and the text "Works flawlessly".

The safe application

What about the application?

- If you don't want to write your application in assembler you are going to need a **runtime and compiler** for a high-level language.
- Here is what Red Hat has done for **C**, but what about **C++ and Rust**?

Useful stuff also assessed by Red Hat

- **systemd**: system and service management
- **podman**: container management tool
- **dbus-broker**: interprocess communication
- **mixed criticality**: allow non-safe and safe applications to run side by side within the same operating system

Safe automotive use-cases

Instrument Cluster Tell-Tales

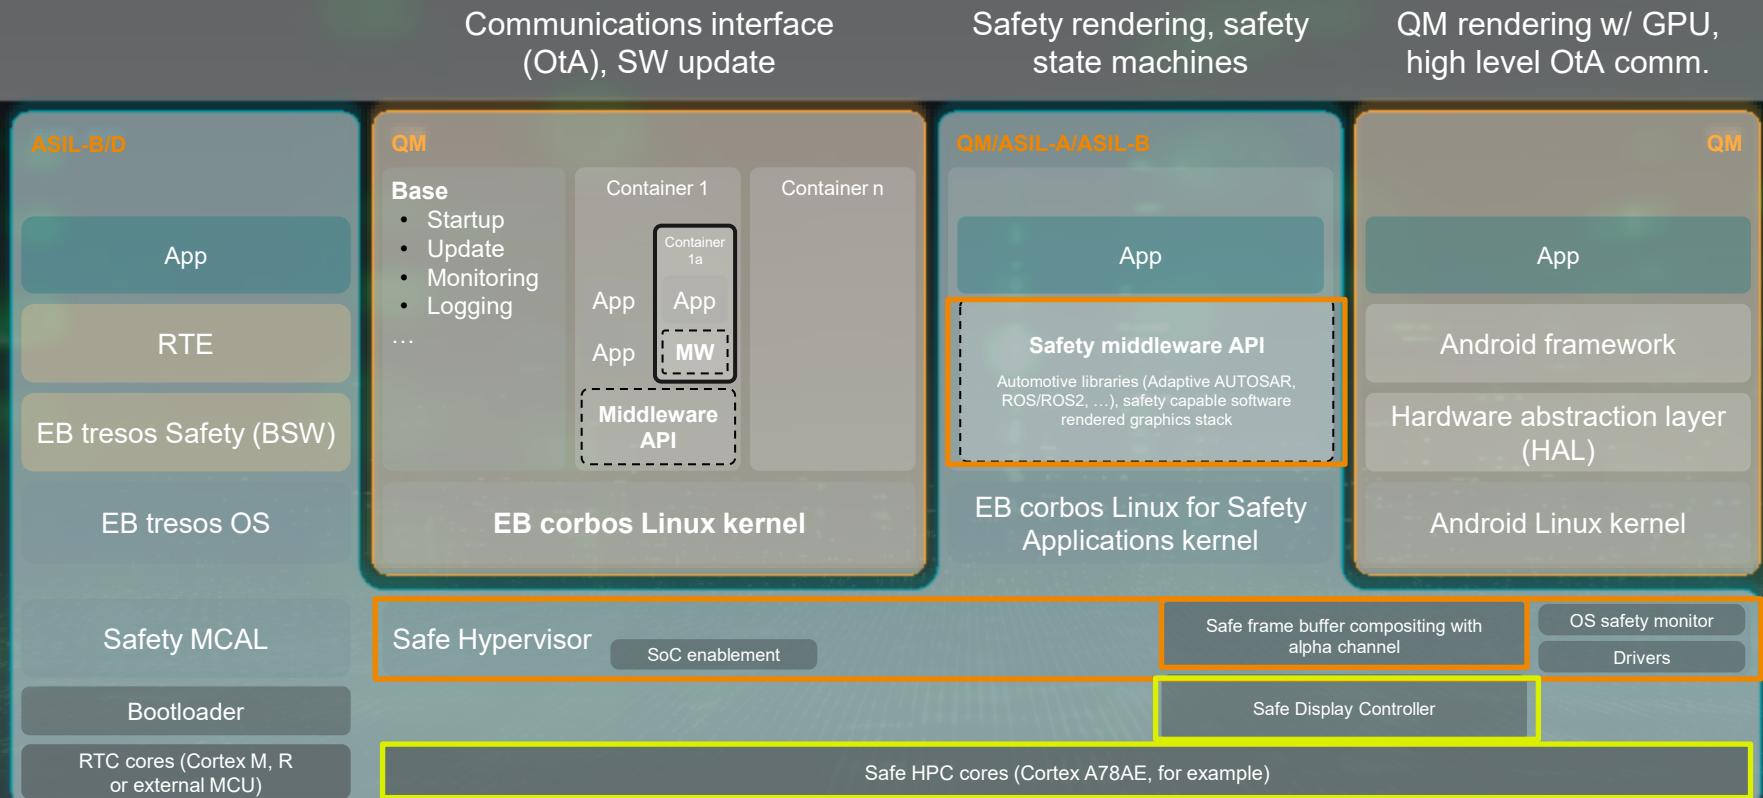

ASIL-B

Use-Case

- **Function:** Notify the driver of important events or vehicle malfunctions.
- **Safety Requirement:** The driver must be informed if the system is incorrectly displaying tell-tales.

Example architecture cockpit/IVI for SDV

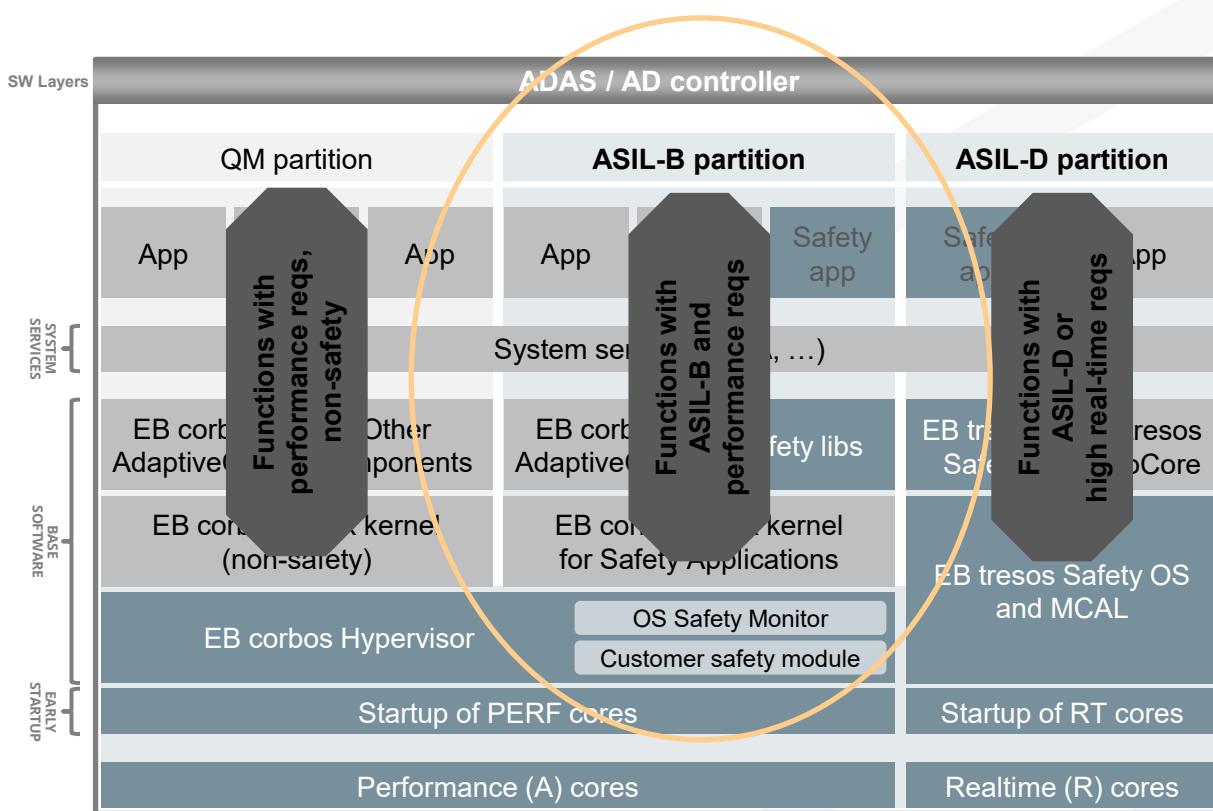

Collision warning; ASIL-B

Use case

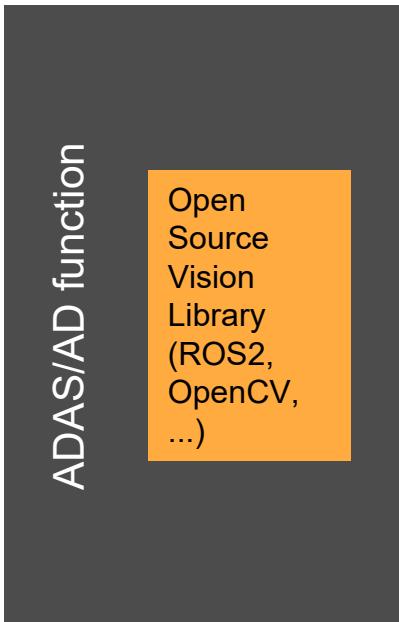

- **Function:** Detect a potential collision and lightly apply the brakes. The driver then has the choice to either continue braking or override the system.
- **Safety Requirement:** The driver must be informed if the system is not functioning correctly or bring the vehicle into the safe state; The most likely cause is a sensor issue (camera, LiDAR, etc.)

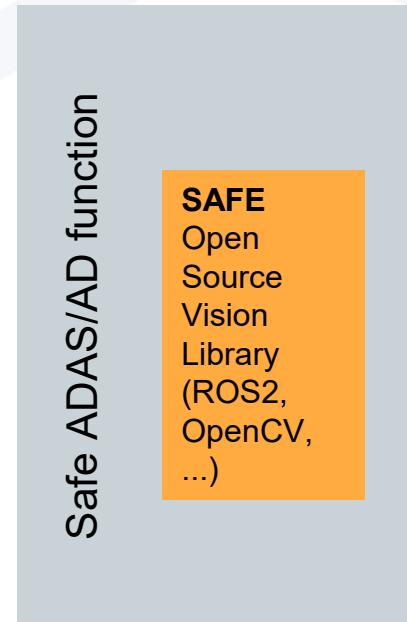

ADAS / AD controller architecture

ADAS Applications: Make it Safe

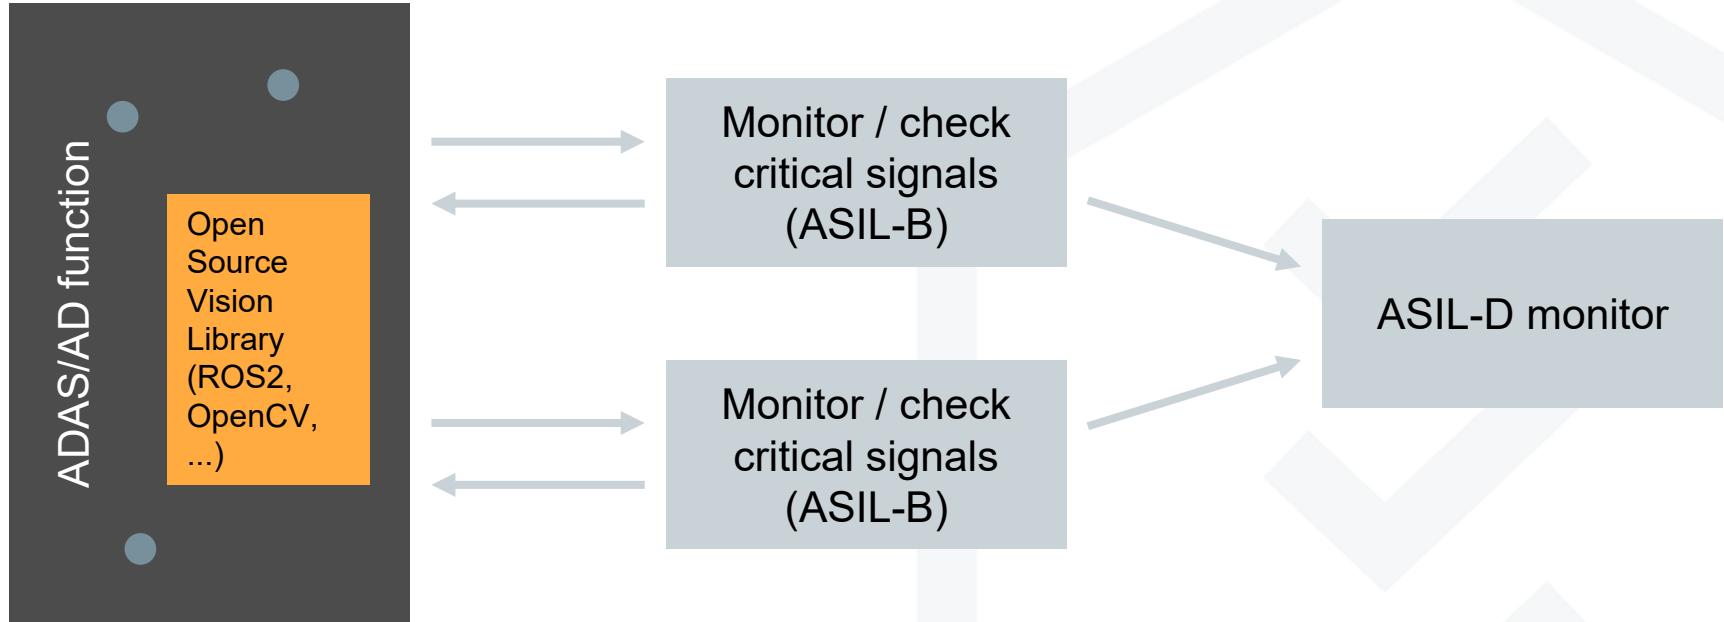

Initial prototype

Production

You need safe versions of big, FOSS libraries!

ADAS Applications: ASIL Decomposition

Add only few components that just ensure you can prove you fulfil your functional safety requirements.

But now you need performant and Safe Inter-process Communication!

Conclusion

- Linux has many advantages over proprietary, safe operating systems BUT
- Potential customers already have solutions that they know work! Switching to Linux is a risk. Just being safe isn't enough.
- The more problems the ELISA community can solve up-front, the faster the adoption of Linux for safe applications will be.
- Simply proving the suitability and compatibility of existing solutions and storing in a knowledge base will often be enough.

ELISA
Enabling **Linux** in
Safety Applications

WORKSHOP

Thank you!
